## Danger Level 3 - Considerable

**AM:**

**Tendency: Constant avalanche danger** →  
on Saturday 28 03 2026

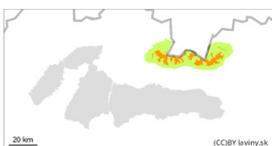

New snow

Treeline

Snowpack stability: fair  
Frequency: some  
Avalanche size: medium

**PM:**

**Tendency: Constant avalanche danger** →  
on Saturday 28 03 2026

Wind slab

Treeline

Snowpack stability: poor  
Frequency: some  
Avalanche size: medium

New snow

Treeline

Snowpack stability: poor  
Frequency: few  
Avalanche size: medium

Increasing tendency during the day, watch out for more new, wind-drifted snow on steep slopes and in gullies!

Due to unstable snowfall during Thursday and Friday, the avalanche danger in the High and Western Tatras will increase to level 3 in the afternoon. Avalanche release is possible on steep slopes with only a small additional load. Smaller spontaneous avalanches from new snow are also possible.

### Snowpack

A total of 15 to 30 cm of new snow is expected to fall during Thursday and Friday, which will be transported to leeward locations of predominantly southerly orientations during the day as winds pick up. The wind-drifted snow will create unstable snow slabs, pillows and drifts.

### Tendency

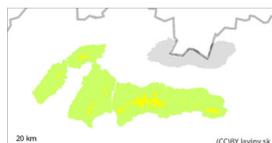

increasing during Friday, persisting on Saturday.

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →

on Saturday 28 03 2026

New snow

Treeline

Snowpack stability: fair

Frequency: some

Avalanche size: medium

Wind slab

Treeline

Snowpack stability: poor

Frequency: some

Avalanche size: medium

Watch out for more new, wind-drifted snow on steep slopes and in gullies!

Due to intense snowfall (1-2 days) a moderate avalanche danger, 2nd degree, has been created in the Low Tatras and Fatras. Avalanche release is possible on steep slopes, especially at higher additional loads. Occasionally, smaller spontaneous avalanches from new snow are possible.

### Snowpack

During Thursday and the following night, 10 to 20 cm of new snow is expected, locally even more. The new snow will be transported to the leeward slopes, into couloirs and under saddles, mainly in the south, southeast and southwest orientations, where it will form unstable snow slabs, cushions and overhangs. The new dry snow is insufficiently bonded to the old snow cover and is therefore susceptible to avalanche.

### Tendency

Slightly rising in strong winds
